The Keymacro application is a general password recovery tool that provides you with the capability to decrypt old passphrases. It is possible to apply different macros to the old passphrase in order to transform it into a new one. This application is compatible with Windows platforms only. Generates new password keys

for old passwords The application provides you with several macros, such as prefix, suffix, number, special character, and keywords, and you can apply any combination of them, depending on what you need. Moreover, it is possible to define macros based on the rule you would like to apply. For example, you can apply a rule that allows users to use the application's default macros, but remove certain characters from the old passwords. Additionally, Keymacro is capable of decrypting old passwords that have been encrypted with different encryption algorithms. Offers various default macros that can be applied to old passphrases Keymacro provides you with many useful default macros, such as, "All caps", "Numbers",

"Special Character", "String Repeat", and "Missing Letter", that you can use to easily recover the password. Dumps old passwords to CSV or PASSWD formats You can dump old passwords that have been encrypted with various algorithms, such as RC4, AES, and Blowfish, to CSV or PASSWD files. The results might seem lengthy, so you need to have a computer with plenty of storage space in order to view them. Supports most of the algorithms Keymacro supports the following algorithms: Blowfish, DES, Triple DES, Triple Blowfish, AES, RC4, SHA, MD5, SHA256, and SHA512. Additionally, it is possible to encrypt the new passwords with the same algorithms, in order to compare them with the old ones. Prepares you for

more advanced concepts Although this application is designed for beginners, advanced users should be able to understand its functions. Saves the decrypted results into a database You can save decrypted passwords into an SQLite database for future reference. Moreover, the application comes with a graphical user interface, so it is much easier to use. Dumps the results to a text file Additionally, you can save decrypted passwords to a text file, so you do not 77a5ca646e

This application allows you to quickly decrypt a password using JtR, an open-source password recovery tool. Visual interface for a password decryption process Upon launching this application, you can access the settings section that will provide you with many options, including the ones that were mentioned above. It is noteworthy to highlight that the Graphical User Interface (GUI) for this application was designed for those who are more advanced and who can operate the application without any issues. However, you might have trouble understanding how to operate it for the first time, or how to make some of its advanced features work. Also,

the application does not include any kind of documentation, so you might have trouble understanding how to use its features. Very easy to use password decryption application As a matter of fact, this application was designed for those who want to gain access to their lost passwords without having to run decryption processes manually. Simple password recovery application with minimalistic design This application was designed to be very easy to use. Hence, it does not include any kind of complex functions and provides you with few features, but it also comes with simple features that allow you to decrypt passwords very quickly. User-friendly interface John's UI is very simple, which makes it even easier for you to understand its functions.

This application provides you with a settings tab that includes the options mentioned above. Also, it comes with an export button that allows you to export the decryption results to CSV or PASSWD formats. Once you open this application, you can simply access the settings tab and use it to navigate through the different options, as well as to export the results. Does not include any form of documentation As you might have noticed, this application does not include any kind of documentation. This is because, although it comes with several features that might be very useful, a lot of people might not be familiar with them. Also, the lack of any kind of documentation might make it a little bit difficult to understand how to operate this

application for the first time. Does not come with comprehensive documentation Although the above applications might have limitations, they do not come with the same kind of issues. They all come with comprehensive documentation that can help you understand them better and to operate them. The following table provides a detailed comparison between all the software listed above. See also List of open-source hardware projects References The present invention relates to a method and apparatus for detecting the so-called color balance or value of a color original for photography. More particularly, the invention relates to an automatic color-balance detecting apparatus adapted to detect the color balance of a color original such as a negative film. In the photographic industry, it has been a common practice to develop a photoprocessing laboratory by making use of a tandem (double-exposure) photography system. In a

photographic negative film, each color image is formed from a single color layer through two exposures. The first exposure is carried out to record the visible image, and the second exposure is carried out to record the latent image which will appear as the backing image for the next printing operation. During the latent image recording, the density of each color image in the color negative film changes depending on the ratio of the positive and negative printing exposure. This is called the so-called "color balance" or "value". In this specification, these terms are used in a broad sense to signify the relation between the density of an image and the color balance. For example, a color negative film may have a color balance which indicates

a desired value of a density of 0.5 (for instance, in a photograph of a face with the eyes being most conspicuous). In this case, the density of the face with the eyes being most conspicuous is 0.5, while the density of a portion other than the eyes (for instance, a lower portion of the face) is 0.2 to 0.3. The color balance (density of 0.5) of the film is determined based on the visual effects which should appear in the finished print when the density of the eye portion is 0.5. If the density of the eye portion is 0.5, the density of the portion other than the eyes is 0.2 to 0.3. The appearance of a finished print is not necessarily fixed, depending on the output condition of a printing paper or the like. Therefore, a color negative film

having a "tint" or "value" of 0.5 (which means a positive/negative ratio of 1:1) is normally used in practice. The color balance, or value, of a negative film or a positive film is preferably detected to adjust the image density during the image recording process, before the first print is made from the film. The print in the first printing operation normally suffers
