results show that the experimental groups (composite fillers with PDLMA) had higher wear resistance than did the control group, which may be because of the presence of the PDLMA. These findings are in agreement with those reported by Wolff et al. \[[@CR27]\], and Rodriguez et al. \[[@CR14]\]. The results obtained in this study showed that composite fillers with PDLMA did not present any cytotoxicity at 24 h, and after 7 days, all the experimental groups showed high viability. However, after 21 days, the composite fillers showed a significant reduction in viability, compared to the control. The cytotoxicity may be due to the presence of residual monomers. In this study, there was no significant difference in the cytotoxicity between composite fill

Category:Communications equipment[An evaluation of the effectiveness of correction of the general water and nutrition status of preschool children living in urban areas]. The objective of the present research is to evaluate the effectiveness of interventions applied for improving the general nutrition and water supply of preschool children living in urban areas. In 2007, a survey was carried out in a group of 944 children, boys and girls of preschool age (2-6 years) in the city of Suzdal. The body mass index (BMI) of children was used to determine the nutritional status. Children from the control group were given no training. In the first and second years of intervention, a monthly cycle of the training of preschool children was conducted. Each cycle included 10 lessons. In the course of the first year of intervention, it was

---

found that the water quality of 97.9% of the dwellings in the city was at an acceptable level. In the course of the second year of intervention, the quality of water supplied to 97.9% of the dwellings was acceptable. In the study group, the quality of water was 85.4% acceptable. In the first and second years of intervention, it was found that the quality of water supplied to the dwelling was 76.3% acceptable, i.e. was worse than in the control group. For example, water pollution with blood, tobacco residues, as well as ground substances was the most common. Based on a comparison of the efficiency of interventions, the authors recommend the combination of the measures implemented for the first and second year of intervention (72.6% of dwellings and 87.4% of the dwellings, respectively) and the supervision of the 4bc0debe42
